The text, “A Brief History of Web Design for Designers” introduced a tension, and a sort of butting-heads, between designers and web developers that I hadn’t realized existed. After reading I can understand the discrepancies both groups experience, both not fully understanding what the other does. The latest entry on the web design time line, 2014—a bright future, is leading towards a direction I hope we can experience in the future. This new technology, ideally giving designers more flexibility and knowledge to create clean and successful code but also allowing developers to focus on solutions to more complex issues rather than wasting their knowledge elsewhere, sounds like the perfect recipe for a future of seamless web design. Both components to this ideal future, designer and developer, could be rationalized to be combined into one job. But I would disagree. Both parts, even with full knowledge of the other, originated with a dominant start. Knowing both is an important and useful skill, but having collaboration with different perspectives to web design is what will aid in continual growth for the future’s future.
